

## **Relative poverty, British social policy writing and public experience**

### **Abstract**

Relative poverty (which categorises as 'poor' those who fall seriously below normal nationwide material standards) is undoubtedly a useful and important concept in social science. However, this article argues that the widespread view that the word 'poverty' means 'relative poverty', which in mainstream social policy academic writing often extends into implying that those (including many poorer people) who do not define poverty this way are necessarily misguided, has led to an incomplete portrayal of the lived experience of poorer British people. The article examines published empirical work, before presenting findings from British Social Attitudes surveys and interviews with 40 unemployed Jobseeker's Allowance claimants and 30 employed people. Both the existing and new findings exposed aspects of public attitudes and experience which resonate with noted unanswered academic criticisms of defining poverty as relative poverty, and which have tended to be glossed over or treated dismissively by social policy authors.

**Key Words:** relative poverty, Sen, Townsend,

### **Introduction**

Relative poverty was developed by Peter Townsend in opposition to 'absolute poverty', which classes people as poor if they do not have enough material resources to physically function properly (for a detailed discussion see, for example, Alcock, 2006). Relative

poverty categorises as 'poor' all whose income falls seriously behind national material standards:

Individuals, families and groups in the population can be said to be in poverty when they lack the resources to obtain the types of diet, participate in the activities and have the living conditions and amenities which are customary, or at least widely encouraged and approved, in the societies to which they belong. Their resources are so seriously below those commanded by the average individual or family that they are, in effect, excluded from ordinary living patterns, customs and activities. (Townsend, 1979: 31)

This article argues that while relative poverty is undoubtedly a useful and important concept in social science, the widespread view that 'poverty' necessarily means 'relative poverty', which is most pronounced in mainstream social policy academic writing, has led to incomplete portrayals of the experience of people near the bottom of the British income distribution. The first part examines two unanswered criticisms of relative poverty – both of which concern its inability to properly demarcate a particular level of hardship brought about by a lack of material resources. As I explain, these criticisms are overlooked or treated dismissively in much mainstream British social policy writing; when people below the relative poverty line claim they are not in 'poverty' they are often said to be in a state of 'denial', despite their reasons for taking that view echoing the aforementioned unanswered criticisms of relative definitions. The second part presents findings about public attitudes and experience from recent British Social Attitudes surveys, and interviews with 40 unemployed Jobseeker's Allowance (JSA) claimants and 30 employed people (10 building

site workers, 10 teachers and 10 retail workers). This research shed further light on people's attitudes towards, and experience of, life on a relatively low income, in ways relevant to the main arguments in debates about poverty definition. A conclusion reflects upon the article's main points.

### **Criticisms of defining 'poverty' as 'relative poverty'**

Peter Townsend's (1954; 1979) relative poverty recognises that people have social needs, and that more shame, embarrassment and feelings of being excluded tend to result from an inability to buy things if those around you have them. Moreover, it is helpful to debates about inequality of outcome and opportunity, as it identifies people whose standard of living is seriously behind that of the average citizen. But while relative poverty is a useful and important concept, its use as a definition of the word 'poverty' has been subjected to two criticisms which have not been adequately countered<sup>i</sup>.

#### **Criticism 1: Sen and 'absolute' conditions**

Amartya Sen (1983) argued that entirely relative definitions like Townsend's do not properly demarcate those in genuine material hardship (as poverty definitions should) because they neglect 'absolute' conditions. To illustrate, people at the relative poverty line in one of the world's richest countries are in a far better condition than those at the relative poverty line in one of its poorest, because while both are in the same condition in one respect (as their income is about the same proportion of their nation's average), those in the richer country have far greater 'absolute' purchasing power and are much further from starvation.

Townsend's (1985) detailed response to Sen's (1983) article was unable to offer a counter-argument on this issue. Indeed, no-one else has been able to offer one.

### Criticism 2: Piachaud and nationwide normal material standards

The second unanswered criticism is that what are considered 'normal' (or 'customary', in Townsend's definition of poverty, see above) activities and material standards vary considerably *within* countries. This criticism emerged when David Piachaud (1981) challenged Townsend's (1979) claim that poverty can be measured objectively. Piachaud noted that individuals' spending patterns differ considerably and that people often go without items Townsend (1979) considered indicative of not being poor or deprived, such as a cooked breakfast, through choice. Moreover, the British population has become even more diverse in its consumer choices since the time of Piachaud's (1981) article (see, for example, Ransome, 2005), so it is arguably now even less appropriate to talk of nationwide 'customary' activities. Indeed, consumer choices and what people consider normal material standards vary so much in countries like Britain *because they are so unequal*, and the British income distribution is far more unequal now than it was when Piachaud was writing (see, for example, Cribb et al., [2013]). Millions of people buy the more expensive clothes, food, and cars, while millions of others buy clothes and food at a fraction of that cost and travel by bus or walk – yet both groups' expenditure patterns are normal in Britain in 2015. Indeed, people's views about what constitute normal standards (see Townsend's definition, above) of income and expenditure will be influenced by personal experiences, which are social class-based to some extent, so individuals' self-perceived normal standards are likely to vary considerably. Indeed, McKay's (2004) quantitative analysis indicated that they do vary considerably, and my in-depth research on a diverse sample presented here can shed

further light. In short, Townsend's poverty definition is reliant upon society-wide material standards which are unlikely to exist.

If the two main criticisms of relative definitions of poverty are considered together, it might be suggested that people living at the relative poverty line in richer countries like Britain are not only certainly better off than their counterparts in poorer countries, they will also, in general, have lower self-perceived normal income standards than most other people in their own country because they are likely to have lived in poorer households and neighbourhoods (if we are correct to assume that poorer people have these lower normal income standards). Hence, it might be argued that authors who overlook the two main criticisms of entirely relative definitions risk overestimating the subjective hardship experienced by poorer British people. The rest of this article argues that this is the case; I first examine social policy writing about poverty and then present my own evidence.

### **Politics, poverty definition and British social policy writing**

The weaknesses of the relative definition described above are well known, but politics is important to understanding why some commentators consider them sufficient to render the definition worthless while others insist they are merely minor imperfections. All (or nearly all) commentators, regardless of how they define poverty, agree that it is a terrible problem that should be solved as a matter of urgency. How poverty is defined determines the scale of the problem that *must* be solved, so those on the political left, who want more vertical

redistribution of income and wealth, will perhaps be more inclined to support broader definitions (like relative poverty) that show larger numbers of poor people. Moreover, poverty rates are unquestionably a key yardstick against which countries are judged, so it is important to note that different definitions can portray particular socio-economic systems more negatively or positively. The relative definition overlooks capitalist countries' typically high average incomes per head and their success in virtually eradicating manifestations of 'absolute poverty' such as hunger, yet it highlights their inherent inequalities, unless these inequalities are strictly limited by state interventions near the bottom of the income distribution. These points lie at the heart of why some conservative commentators (examples include Joseph and Sumption, 1979; Green, 1990; Marsland, 1996) have fiercely objected to what they see as Townsend's socialist-motivated 'redefinition' of the word 'poverty'. While it is widely agreed that relative poverty is a useful concept which nevertheless has weaknesses, those on the political right often portray its weaknesses as catastrophic flaws, while those on the left often portray them as insignificant<sup>ii</sup>.

These are important considerations, as British social policy academia (where debates about poverty mainly take place) is left-dominated and has noted links with 'poverty lobby' organisations, such as the Child Poverty Action Group, which campaign to increase poorer people's incomes (see Deacon, 2002; Welshman, 2012; Author A). Therefore it is perhaps unsurprising that academics tend to consider it acceptable to use the terms 'poverty' and 'relative poverty' interchangeably. While relative poverty is accepted and 'taken as read' as *the* meaning of the word 'poverty' in much social science writing, some mainstream social policy academics who write about poverty have gone further by implying that those who do not take this view are necessarily misguided. This becomes clear in these authors'

discussion of people below the relative poverty line who say they are not poor. For example, Townsend (1979: 425) wrote of his respondents' 'personal denials of poverty'. More recently, Shildrick and MacDonald (2013) wrote of their respondents' 'denial of poverty' (p.293), commenting that 'despite living in sometimes severe, material hardship our [60] interviewees [from Teesside] denied that "poverty" described their conditions of life' (p.286).

This apparent view that relatively poor people who say they are not in 'poverty' are necessarily wrong persists despite some social policy authors expressing a desire to include their perspectives in poverty discourse (see Beresford and Croft, 1995; Beresford *et al.*, 1999; Lister, 2004: 2), and despite the public's views on other topics being taken seriously by poverty authors (particularly their views on what constitutes a 'necessity', which have been considered useful enough to derive 'consensual' measures of poverty from [see Lansley and Mack, 2015; Pantazis *et al.* eds., 2006]). Importantly, the reasons members of the public give for rejecting the view that poverty should be defined as *relative* poverty tend to closely fit the two unanswered academic criticisms of relative poverty I described earlier. For example, while none of Shildrick and MacDonald's (2013) interviewees said they found life on state benefits comfortable, they nevertheless tended to associate the term 'poverty' with more extreme conditions, notably famines (other major studies have found the same, including Golding and Middleton, 1982, and Beresford *et al.* 1999):

For many, it was TV images of absolute poverty in Asia and Africa that sprang to mind when we initially asked them about their views on poverty. They were

quick to reject the term as having relevance to their own lives. (Shildrick and MacDonald, 2013: 289).

As these authors noted, their respondents perhaps sought to distance themselves from the stigma the word 'poverty' carries. Nevertheless, it is noteworthy that their respondents' implied view, that the word 'poverty' means something more stable across times and places than Townsend's definition allows for, is at least broadly consistent with that of Sen.

The second criticism of relative poverty – that nationwide, normal material standards do not exist - emerged particularly strongly in Shildrick and MacDonald's (2013) interviewees' accounts. These respondents' perceived 'normal' material standards were heavily influenced by the standards of people they came into contact with most; as the authors put it, 'socially and geographically close points of comparison diminish a sense of relative poverty and deprivation' (2013: 301). Runciman's (1966) major survey was the first to establish this, and Golding and Middleton's (1982) interviews found the same. Similarly, Townsend (1979: 426) found that those below his relative poverty line whose fathers were in lower social classes were less likely to consider themselves poor. Yet because Townsend, and latterly Shildrick and MacDonald, have taken the view that their interviewees 'denied' their 'poverty', they offered no discussion about how their respondents' belief that their income was fairly normal by local standards (and perhaps even impressive by global standards) might have impacted upon either how unhappy they felt about that income, or how outside observers should view the severity of their suffering. Disregarding the unanswered criticisms of the relative definition, these authors have persisted in writing about the plight of those in relative poverty as if it almost inevitably constitutes severe

hardship. The following extract from Townsend's (1981) response to Piachaud (1981) illustrates this connection between a rigid commitment to the defining 'poverty as 'relative poverty' and a particularly negative portrayal of life on a relatively low income in Britain:

On the basis of the national evidence, I would reject his view that poverty '*no longer* (my italics) conforms to a picture of Dickensian destitution, with the pauper in a pitiable state', and, elsewhere in his article, that the poor are 'not outcasts'. This is fundamentally to misperceive the relativity of the condition of poor people. They are living in the society of the 1980s rather than that of 1840-70; and in this context the conditions of some at least are as bad, or worse, than those which Dickens observed more than a hundred years ago. (Townsend, 1981, quoted in Gordon ed., 2010: 236)

## **Methods**

The research presented here aimed to shed more light on the experience of people on a relatively low income in Britain. In-depth interviews examined 40 unemployed JSA claimants' and 30 employed people's views and experiences in detail, and British Social Attitudes Surveys (BSAS) provided statistically representative patterns of attitudes.

The interviews, sponsored by the British Academy, took place in 2011, when the number of JSA claimants was always around 1.5 million, much higher than the 0.8-0.9 million figure for throughout 2007, before the recession (Office for National Statistics data, see BBC, 2015).

The interviews were semi-structured in order to ask some questions to all respondents

while exploring their perspectives. While questioning was largely about respondents' attitudes towards being employed and towards being unemployed and living on benefits, as well as their actual labour market choices and reasons for those choices, investigating their attitudes towards the monetary rewards of being in paid work, as opposed to being on state benefits, played an important part. In particular, I was interested in whether or not respondents would be tempted into employment by the prospect of receiving £30 per week more than they would on state unemployment benefits. The interviews lasted between 35 and 80 minutes, and most were between 50 and 65. There were seven groups of 10 respondents:

10 JSA claimants (Canterbury, in south-east England)

10 JSA claimants (Lincoln, in the east-midlands of England)

10 JSA claimants (Paisley, in the west of Scotland)

10 JSA claimants (Partick, in Glasgow, in the west of Scotland)

10 Building site workers (Paisley)

10 Retail workers (Paisley)

10 Secondary school teachers (Paisley)

The employed groups were chosen mainly for their contrasting educational attainment levels, which had emerged as important to employment attitudes in an earlier project (Author, B). The locations were chosen to ensure a diverse sample, mainly in terms of social class-based experience. Three of the locations are similarly sized small cities (all have >40,000 and <100,000 residents) yet they vary dramatically in prosperity, with Canterbury the most prosperous, Paisley the least, and Lincoln occupying a middling position; Partick

was chosen for being near to Paisley yet in a prosperous part of the industrial city of Glasgow. The building site workers and teachers were the groups most likely to have grown up far away from the places they were employed or 'signed on' at. Respondents' ages ranged from 17 to 59; the mean was 38 and all groups had a mean age of between 36 and 40, except the retail workers (30). The 39 men and 31 women were distributed approximately equally between groups, except that all the building site workers were male. Around a third overall had dependent children, and the figure was highest among the teachers (6) and builders (5). All but two of the 70 were white and Scottish / English-born, and all but nine (six teachers and three [all young] retail workers) had experienced life on JSA. The unemployed respondents had lived on JSA for a mean total of 2.9 years in their whole lives, which is unsurprisingly higher than the mean figure for building site workers (1.8), retail workers (0.7) and teachers (0.2).

The JSA claimant respondents were approached outside jobcentres, the employed groups through visits to building sites, pubs/cafés and schools. All potential respondents were offered a £10 high-street shop voucher and drink in a café to take part, and virtually all who participated accepted the payment. About a quarter of approaches resulted in an interview; I suspected that participants differed generally from non-participants in their greater interest in the money offered and in the discussion topic.

For the survey research, the BSAS was used because it provides useful questions for shedding light on people's attitudes towards poverty definition and towards the material hardship or otherwise of life on a relatively low income. All relevant survey questions from the last decade of the BSAS were used.

## **Results**

Consistent with BSAS findings (see Table 1), the relative definition of the word 'poverty' was rejected by a majority of interview respondents who expressed an opinion (albeit here it was only a narrow majority), although many did not clearly support or reject it.

Interviewees' reasons for rejecting it broadly match earlier studies' findings (see above).

Respondents usually said or implied that the word 'poverty' meant material conditions more miserable and desperate than those at, or immediately below, the current UK relative poverty line. For example, Lincoln, male, thirties, described his current experience of being on JSA: 'it's not easy, it's tough, in fact it's very tough, but I wouldn't call it poverty'. As in existing studies, people drew upon global and historical comparison when arguing that life on benefits in Britain does not entail 'poverty'; Africa and past centuries in Britain were both cited by several respondents as having large numbers in 'real poverty'. Respondents tended to assign the word 'poor' a more relative meaning than the word 'poverty'; 'poor' often meant poor in relation to those in close social and geographical proximity to themselves (Shildrick and MacDonald [2013] found the same).

TABLE 1 HERE

Respondents who stood out as being most likely to define poverty as relative poverty were those who had experienced more middle class/non-manual backgrounds and occupations, graduates, and those who expressed egalitarian opposition to mainstream political parties. In middle class respondents' case this appeared to be connected to their tendency to regard

living standards at around the UK relative poverty line as unusually tough in comparison with their own experiences. University degree holders were most likely to be already aware of relative poverty (some mentioned their knowledge of it, while others appeared to allude to it more vaguely), and this seemed to account for some of their sympathy towards it. Respondents who bemoaned the extent of inequality in Britain seemed to imply that this consideration impacted on their decision to support a relative definition; even two respondents (Lincoln JSA, female, fifties; Paisley JSA, male, forties) who had said that they found life on benefits tolerable strongly supported relative poverty, seemingly as a consequence of their stated objection to the extent of inequalities in income and wealth. These interview findings on politics (though *not* those on education and class) are strongly echoed by the BSAS findings (Table 1). However, in the case of class, the lack of similarity between BSAS and interview findings might be a consequence of the survey item's wording. Perhaps 'things they really needed' is defined more broadly by more middle class survey respondents in the same way that, as Clery et al. (2013: 7) suggested, it might be defined more broadly by respondents in more prosperous times. Indeed, Table 2 uses survey questions that are explicit about the living standards respondents must have in mind, and here we see that the lower classes tend to be most likely to consider relatively low incomes 'enough to live on'<sup>iii</sup> - a theme that emerged from the interviews strongly, and which I pursue later.

TABLE 2 HERE

I asked respondents how they felt / would feel about living on JSA, which was £67.50 per week for over-25s in 2011 (most people on this income would be classed as poor by popular

relative poverty measures). I gave them a scenario in which they did not have to pay Council Tax and housing costs (though in reality Housing Benefit, which JSA claimants are usually entitled to, does not always fully cover rent) but they would have to pay for other expenditures including food, electricity and gas out of the £67.50. None of the 70 said that this amount provided a truly comfortable standard of living. Respondents mostly came at least close to the view that while living on the amount was 'doable' (as several put it) or enough to 'scrape by and survive' (retail, male, twenties) as it paid for basic necessities such as food and fuel, it was not an adequate amount for funding participation in social events (which often meant one 'night out' per week). Partick JSA, female, forties, for example, said 'it's a real pain. It just allows you to live, you can't explore anything, you can't go away, you can't go to the theatre [or] the cinema'; similarly, Lincoln JSA, female, forties, summed up many respondents' sentiments when she commented 'you can get by, but you can't have any nights out'.

Thus, the respondents implied their subscription to some key tenets of Townsend's argument for the relative definition of poverty – they agreed that people have *social* needs which are specific to time and place, and which require more income to fulfil in some societies than they do in others. Respondents tended to say that around £30 was required for the 'night out', and many said that an income about £30 above JSA-level was adequate or comfortable. For example, retail worker, female, twenties, echoed many respondents' sentiments:

In the past when my rent was paid I always ended up with 100 quid a week, and I've always felt that's enough, it's quite a nice lifestyle. Sixty-five is OK for the

basics, you know, your food, your electricity, but I think everyone has a right to a bit of social life, you know, a few nice things, but I think on 100 quid I never felt particularly rich but it was nice, it was comfortable<sup>iv</sup>.

Yet conversely, when I asked respondents to choose between living on JSA and increasing their weekly net income by £30 by undertaking a job in present-day Britain which they considered unattractive, only a minority said they would choose the job. Indeed, people tended to say they would undertake a job they liked for around the same net income as benefits, but not a job they disliked; thus, the type of work, not the income difference, appeared to be their key consideration. While attitudes towards employment (and debates surrounding them) are not this article's central focus, it is nevertheless noteworthy that respondents did not, in general, consider the predicament of living on JSA and related benefits so desperate that they wanted to escape it as a matter of great urgency. Indeed, given that the extra £30 would, in some cases at least, propel them over the relative poverty line, the finding contradicts the claims of some mainstream social policy writers, for example Spicker (2007: 115), who insisted that 'when people have a choice they do not stay poor'. Indeed, earlier evidence from Ireland suggests that people sometimes choose to remain in relative poverty in preference to undertaking jobs they consider unattractive (Nolan and Whelan, 1996). Nevertheless, while interviewees were not usually enticed by the prospect of relatively small economic gains, their lengthy descriptions of their lives in the labour market showed that virtually all had been willing to work for wages much higher than state benefits, even in jobs they did not like.

Having noted general patterns in the 70 accounts, I now focus on differences between sub-groups. People who had grown up in the most deprived households and locations were most likely to consider a JSA-level income at least fairly normal and to report being able to cope fairly comfortably on it (which matches Table 2's social class findings). Two female, Paisley JSA claimants, both over forty, fitted this description more than anyone else. For example, female, forties, was asked if she believed that JSA was enough to live on:

It is enough, of course it is... [food is] just for me a tenner [per week]...my gas is a tenner and that might do me a week and a half, electricity is a tenner and that might do me a week and a half...I don't really eat much...ten pound, go to ASDA, buy your food [for the week].

However, money was usually of paramount importance to these and other more working class respondents, so they were the most attracted by small economic enticements. For example, Lincoln JSA, male, fifties, spoke of placing high importance on money and of his moving from job to job in the same industry as a consequence of being offered slightly higher wages.

At the other end of the spectrum were those who said they considered JSA an 'unthinkable' amount to live on (teacher, female, thirties) or 'a joke' (building site worker, male, fifties), and those who spoke bitterly about the daily financial struggle they faced on JSA (e.g., 'there's no money for the last four days of the fortnight', Partick JSA, female, forties, which matches one of Patrick's, 2014 findings). Those from more middle class backgrounds who had experienced lengthy periods in well paid jobs were the most likely to view JSA income

as completely intolerable, an attitude they usually attributed to being accustomed to a much higher income. For example, Partick JSA, female, thirties, who had recently 'signed on' for the first time said 'I've been used to...going out to dinner three times a week...I'd have to have a lobotomy to live on [JSA]...it just limits your choices'; Likewise, Canterbury JSA, female, forties, also a first-time JSA claimant, said 'I've never had to budget, now having to budget it cannot be done' - both said they were currently spending savings. The sharp contrast between these respondents' comments and those of people who had lived more working class lives was reflected in the rest of their accounts, which showed that their perceived 'normal' living standards reflected their own lived experiences and the living standards of those around them, as Runciman (1966) and Shildrick and MacDonald (2013) also found.

A few of the youngest JSA claimants who were, as yet, unaccustomed to full-time wages and were used to living on a lower rate of JSA (£53.45 in 2011), were also among the small minority who said that living on £67.50 was not difficult. Past studies of the young unemployed have found that they are most likely to consider unemployment benefits adequate for these reasons (see Pahl, 1994), and Table 2 shows that younger people tend to be the most likely to consider benefit-level income adequate. Lincoln JSA, female, teenager, explained:

I could live off [£67.50] easily, [my boyfriend] always says I can live off peanuts',  
I think it depends on the person because some people could [live on that] and  
some people would really struggle...But I think it's about what you deem  
necessary to live on...I'd quite happily buy *Value* 20p shower gel, but I'd eat

decent food. If you just don't spend money on things you don't really need you can do it.

A group of six with a distinctly low interest in material possessions and more counter-cultural attitudes was identified. Four of this sub-group had fairly normal expenditure patterns, but none could be described as consumerist, and while all six considered living on JSA to be far from ideal, it did not hurt them enough to encourage them to apply for the wide variety of Minimum Wage jobs they considered unpleasant or uninteresting. Indeed, this sub-group illustrated (in exaggerated form) many respondents' view that escaping relative poverty was not an urgent priority. For example, Paisley JSA, male, forties, a University graduate, said of the offer of a £30 net gain to do an unattractive job, 'that's not an incentive, that's nothing'. Another, Partick JSA, male, thirties, was also a graduate and had been on JSA for a total of three of the last six years. He said that he was applying only for jobs in computing, and that he preferred living on benefits to undertaking all attainable non-computing jobs (though he acknowledged that he would try to obtain a more substantial income through employment if he had a dependent child, as did the previous respondent I quoted). His comments show implicit support for Sen's (1983) criticism of the entirely relative definition of poverty for its neglect of absolute standards, which was also found outside this sub-group (albeit to a far lesser extent):

Money for me is not the major motivator in my life....I see the whole cost of basically the 40 hours or whatever a week...you are losing like a 70 per cent quality of life for a 30 per cent increase in finances which might only increase your quality of life by 10 per cent or something... I've got internet non-stop, 24 /

7 entertainment, I have friends, I don't have to think about violence, wars, repression, I have almost zero stress whatsoever, and all just so that I, for all that I just have to give up a holiday abroad once a year and, say, some new clothes every couple of month, and I think it's a fair trade, but there's other people, obviously, find it difficult to live like that...To me I think I live like a king, and compared to how a king lived in the last century, I think I live better, so I find it hard to consider myself below the poverty line....If you are frugal with your cash you can actually live quite well....20 pound a week on food maybe, and then electricity bills are maybe about 10 or 15 pound and that leaves about 25 to 30 pound.

This quotation illustrates another recurring theme of the interviews, that beyond the few items respondents considered essential (these were society-specific basics, mainly gas/electricity, food and rent) there were very few items that respondents said they would suffer considerably without; as a consequence, they were able to focus their expenditure on purchases that really mattered to them (in the above respondent's case, access to the internet). This approach to budget management could entail buying cheaper versions of particular items they considered relatively unimportant (examples include the Lincoln JSA teenager quoted earlier, and Canterbury JSA, male, forties, who said that during a lengthy past unemployed spell he had 'lived on beans on toast so I could afford enough alcohol in the pub'). For these reasons, while JSA claimant respondents acknowledged that missing out on many of the items they could have bought if they had lived on national median income (or missing out on better quality versions of the items they did presently buy) was undoubtedly regrettable, few reported it as a major source of distress. Indeed, people on

incomes near the median in richer countries are perhaps now spending a growing proportion of their income on products and services which many people do not have (and which are, therefore, items whose absence is unlikely to cause serious distress) – see also, for example, McKay’s (2004) discussion of these issues. Hence, it might be suggested that, as countries like Britain become richer, it becomes easier to avoid shame, misery and a sense of exclusion at, say, 60 per cent of median income (i.e. where the most favoured relative poverty line is positioned). Others might counter this suggestion by pointing out that society-wide essentials (perhaps we might call them ‘era-specific basics’) one would feel bereft without are increasing both in number (e.g., the internet, as we enter an era in which the vast majority of the British population are online) and in cost (e.g., electricity bills have risen dramatically this century). Certainly, it would be interesting to investigate further how rising average incomes and increasingly diverse consumer spending patterns might have changed the experience of being relatively poor in Britain.

### **Conclusion**

Relative definitions of poverty cannot properly demarcate a level of hardship because they neglect *absolute* conditions (people at the relative poverty line in richer countries are clearly better off than their counterparts in poorer ones) and because they fail to recognise that individuals’ perceived normal material standards vary considerably *within* countries. The limitations of relative definitions of poverty are recognised not only by academics but also the public, as various empirical studies have shown, including the one presented here. People usually associate the word ‘poverty’ with harsher conditions than those found just below the British ‘60 per cent of median income’ relative poverty line. While people do take

into account their fellow nationals' incomes when defining poverty and when deciding how economically well off they consider themselves to be, they tend to make comparisons with those in close social and geographical proximity to themselves (*not* with national standards). When they live on an income that is low by national standards they often find that forgoing what they consider non-essentials, in order to save money for the few items that are important to them, enables them to cope at least fairly well. So the evidence suggests that, while living slightly below the poverty line in Britain is far from comfortable, it does not usually entail the desperate hardship that the word 'poverty' usually evokes in people's minds.

Yet despite the relative definition of poverty's noted flaws, academics still routinely use the terms 'poverty' and 'relative poverty' interchangeably, and their commitment to the relative definition is sometimes so strong that it has extended into suggesting that poorer British people who say they do not live in 'poverty' are in 'denial'. These authors' stance has arguably led to a neglect of some important aspects of poorer British people's experience. Only when researchers foreground realities that do not sit comfortably with relative definitions of poverty will a more complete picture of the lives of the poorer citizens of richer countries emerge.

## **Notes**

- i. This article focuses only on criticisms of relative definitions of poverty about income, because its author believes that poverty is only about lacking material resources; others have criticised relative definitions/measures for neglecting related problems such as substance addiction (Wardle and Walker, 2013).
- ii. In my view the picture is a little more complicated than this: occasionally, radical left commentators argue that relative poverty draws attention away from wider structures of inequality in capitalist society, due to its implication that all is well as long as everyone is above the poverty line (Westergaard et al., 1976: 123; Levitas, 2005 made a very similar point about the closely related, broader concept 'social exclusion').
- iii. Note that, in Table 2, for two of the four questions a majority of manual workers say they have 'enough/more than enough' to live on, while it is only one of four for non-manuals.
- iv. Respondents are certainly referring to their actual disposable income (detailed information was gathered about their benefit entitlement, debts, savings, costs of dependent children etc. which can affect the exact financial circumstances people face).
- v. Meaning a very low income.

**Table 1: Percentage of social categories agreeing with defining ‘poverty’ as ‘relative poverty’**

Question			% answering ‘in poverty’	
			YEAR	
			2010	2006
Would you say someone in Britain was or was not in poverty if they had enough to buy things they really needed, but not enough to buy the things most people take for granted?	Class	Non-Manual	20.1 (1897)	20.2 (1863) <i>sig.</i>
		Manual	22.6 (1228) <i>no sig.</i>	24.1 (1230) <i>P&lt;0.01</i>
	Education	Higher education	20.4 (1063)	23.8 (963) <i>sig.</i>
		Below higher education	21.6 (1916) <i>no sig.</i>	20.9 (2197) <i>P&lt;0.01</i>
	Politics	Left	29.3 (905)	27.0 (834)
		Centre	19.1 (881) <i>sig.</i>	22.7 (957) <i>sig.</i>
		Right	13.8 (965) <i>P&lt;0.001</i>	15.3 (978) <i>P&lt;0.001</i>
	ALL BSAS SAMPLE	21.4 (3297)	21.8 (3228)	

**Source: British Social Attitudes Survey data, 2006/2010**

*Notes: Response options were ‘in poverty’, ‘not in poverty’ and ‘don’t know’ (‘don’t knows’ comprised fewer than 3% of responses in both 2006 and 2010) and all were included in calculating the above percentages. Figures in brackets are the total number of respondents in the social category. ‘Politics’ is derived from the BSAS left-right scale and scores are cut to deliver similarly-sized groups (Left = <2.4, Centre = between 2.4 and 2.8, Right = >2.8).*

**Table 2: Percentages of social categories agreeing that people on particular incomes have enough/more than enough to live on**

Social Category		% agreeing that a pensioner living alone, whose income (after rent) is £119 a week (in <b>2008</b> ) has 'enough/more than enough to live on'	% agreeing that an unemployed single mother with a young child, whose income (after rent) is £130 a week (in <b>2008</b> ) 'has enough/more than enough to live on'	% agreeing that a couple living together without children on £88 per week (after rent) unemployment benefit (in <b>2005</b> ) 'have enough/more than enough to live on'	% agreeing that a couple living together on £171 per week (after rent) state pension (in <b>2005</b> ) 'have enough/more than enough to live on'
Age	17-24	49.7 (380)	41.3 (380)	40.7 (354)	83.4 (356)
	25-39	43.9 (850)	47.2 (850)	35.4 (867)	74.8 (869)
	40-64	29.8 (1376)	46.8 (1372)	26.4 (1288)	69.2 (1293)
	65+	32.9 (665)	52.0 (650)	24.3 (638)	62.4 (647)
	<i>Significance</i>	<i>P&lt;0.001</i>	<i>P&lt;0.05</i>	<i>P&lt;0.001</i>	<i>P&lt;0.001</i>
Class	Non-Manual	34.8 (1852)	44.5 (1840)	28.3 (1802)	69.4 (1810)
	Manual	38.1 (1314)	52.3 (1307)	32.0 (1239)	73.3 (1248)
	<i>Significance</i>	<i>Not significant</i>	<i>P&lt;0.001</i>	<i>P&lt;0.05</i>	<i>P&lt;0.05</i>
ALL BSAS SAMPLE		36.3 (3287)	47.3 (3268)	30.0 (3149)	71.0 (3167)

**Source: British Social Attitudes Survey data, 2005/2008**

*Notes: Percentages agreeing are calculated by combining those who answered 'has/have more than enough to live on' or 'enough to live on' (as opposed to 'is/are hard up' or 'is/are really poor'). Figures in brackets are the total number of respondents in the social category. Amounts of money quoted in the survey questions match the typical state benefit entitlement of the social categories.*
